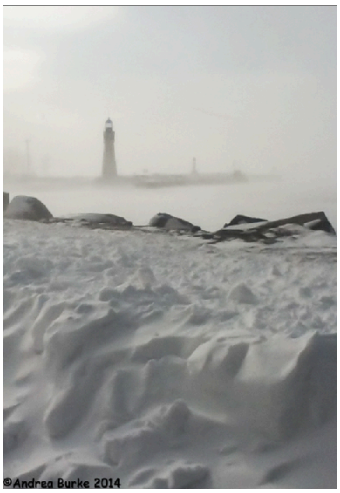
A Double Stroke

To use a decorative double stroke around a projected image, follow this variation on the original instructions.

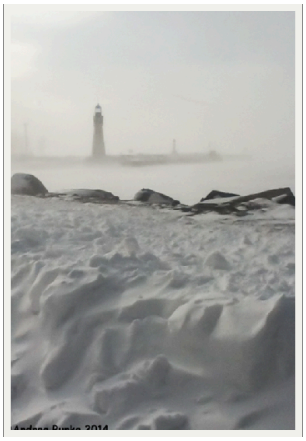


Original Resized Image

The image should be adjusted, and resized for projection.

Using the color picker tool (eye dropper) select a color from the image which is brighter than average. This color will appear as the foreground color in the color picker.

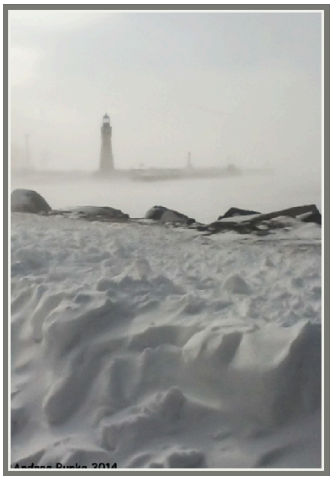
Go to: Select/All. Go to: Edit/Stroke In the window that opens make the pixel width about 12. This will create a wider stroke than is usual.



with wide stroke

Now use the color picker tool to select a mid-tone from the image. It should be darker than the first stroke but light enough to contrast with a black background. I chose a mid-tone from the rocks.

Once again I selected "All" and went to Edit/ Stroke. Now I chose a narrower stroke. I used 8 pixels.



After double stroke

To see how the image will look when projected, Right click (Control click on Mac) on the screen outside the edge of the image and choose "black" for the background color. This is a good preview of how your image will look when projected.
